

VEHICLES WITH ATRS™ INTEGRATION

Shown in a 2008 Chevy Suburban

ATRS, Automated Transport and Retrieval System, is a revolutionary transportation mobility solution that integrates robotics and automation technology with existing mobility products. It will enable those with limited mobility who use powered wheelchairs to independently load and unload their wheelchairs from a wide range of standard passenger vehicles that fully conform to NHTSA safety requirements.

ATRS will provide a driver the ability to use their vehicle without the assistance of a caregiver. For passengers, ATRS will relieve a significant burden from their caregivers of loading and unloading the person from the vehicle and then storing their power wheelchair.

An integrated system for independent driving
